

1) Logo

- Change the existing logo to the new/provided logo.

2) Home Page – Timeline Banner

- Change the current background design.
- Instead of using a single static background, implement a **dynamic timeline/banner**.
- The background should automatically change approximately every **3 seconds**.
- Around **4–5 different background images/designs** can be used for the rotation.

3) Enquiry Options & Placement

Home Page

- Remove the **Enquiry Box** currently displayed within the Home Page timeline/banner.
- Keep only the static **top-right button**.
- Rename “**Enquire Now**” to “**Quick Enquiry**”.
- The **Quick Enquiry** button should directly redirect users to **WhatsApp**.
- The full-fledged/detailed enquiry form should remain available as a **separate enquiry page/window**.
- Existing **Enquire / Get Quote** buttons on other sections/pages can remain as they are, but they should redirect to the **Detailed Enquiry page**.
- The “**Send us Enquiry**” section at the bottom of the Home Page is fine and can remain unchanged.

About Page

- Remove the enquiry section at the bottom of the About Page.

Services Page

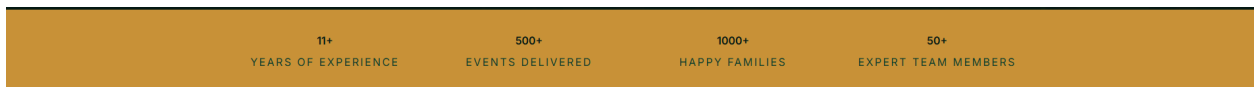

- Keep the “**Request Quote**” section/button at the bottom.

Gallery Page

- Keep the “**Book Us Now**” section/button at the bottom.

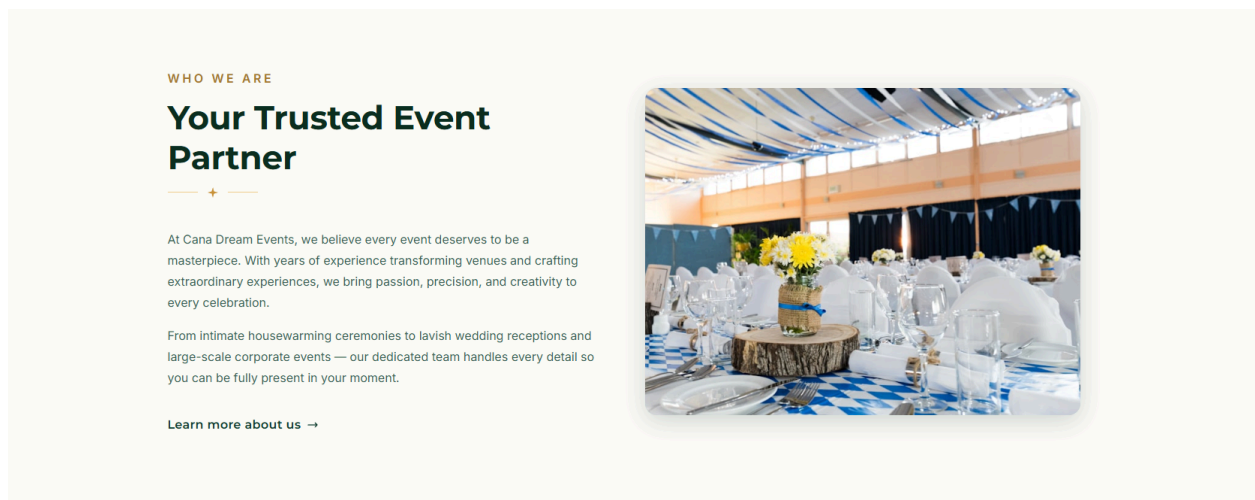

4) Replace Numeric Indicators with Meaningful Text

- As shown in the referenced screenshot, replace the normal numerical indicators with **representative English phrases/text**.
- The phrases should be visually appealing and relevant to the corresponding content rather than displaying plain numerics.

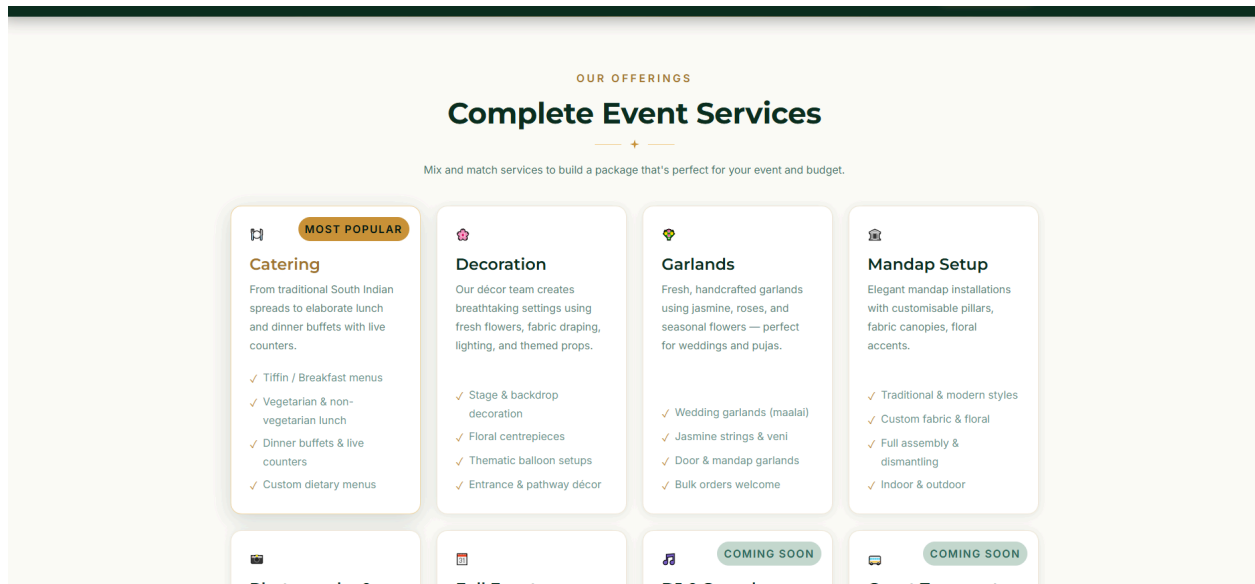

5) Image Panel – Dynamic Images

- As shown in the referenced screenshot, the image panel should not remain static.
- Implement a **dynamic image-changing section**.
- Around **3–4 images** can be used and should automatically rotate/change at suitable intervals.
- The transition should be smooth and visually appealing.

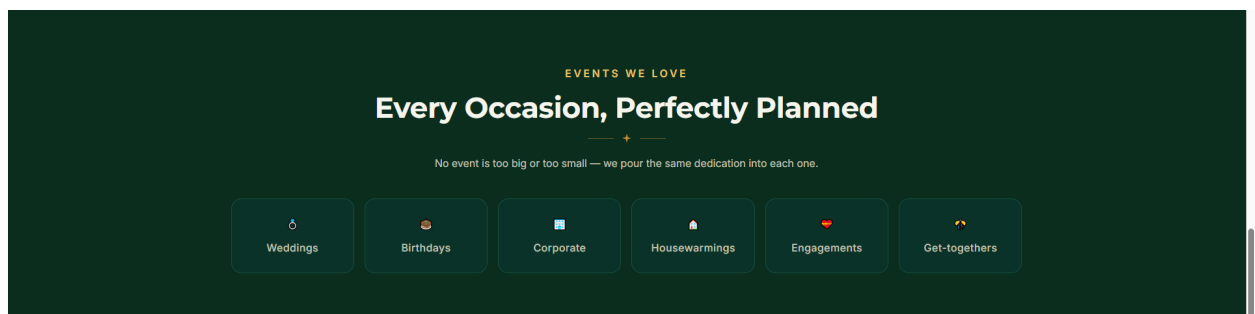

6) Services Category Section – Dynamic Gallery Navigation

- The Services category section currently appears on both the **Home Page** and **Services Page**.
- This section should **not remain static**.
- Each service/category should dynamically lead users to the **Gallery section corresponding to that particular category**.
- For example, selecting a particular service/category should take the user directly to its relevant gallery images.
- The interaction should feel dynamic and intuitive rather than like a static set of cards.

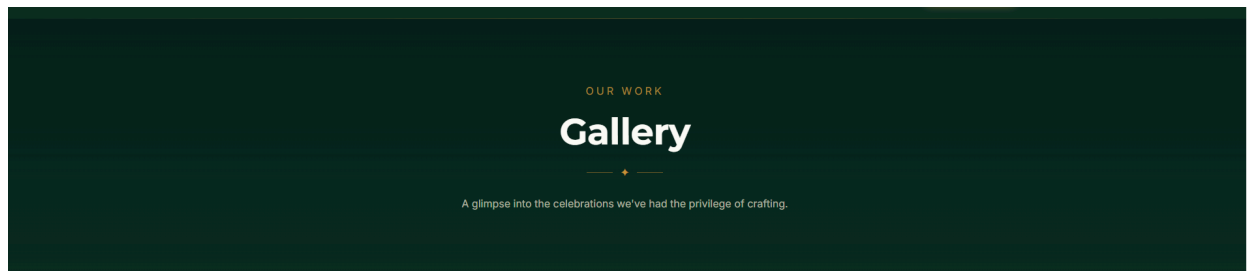

7) Home Page – “Events We Love” Section

- Replace the current small/basic icons with **high-quality pictorial representations/images**.
- Each event category should have a visually appealing image that represents the event.
- The overall section should look more modern, premium, and engaging.

8) Gallery Page – Modernize the Timeline

- The current Gallery Page timeline looks too simple and static.
- Modernize the entire timeline section with a more **premium and visually engaging design**.
- Use a concept similar to **OTT-platform-style dynamic banners** as inspiration.
- The main banner/image should automatically change rather than remaining static.
- Use multiple images/content slides with smooth transitions.
- Avoid keeping the same dark-green theme throughout the timeline; introduce a more **dynamic and visually varied presentation** while still maintaining consistency with the overall website branding.
- The final design should feel unique, modern, and premium rather than resembling a basic static gallery.

9) Contact Page – Enquiry Options

- Currently, the enquiry form is directly popping up on the Contact Page.
- Instead, provide **two separate cards/options**:
 1. **Quick Enquiry** – Redirects directly to WhatsApp.
 2. **Detailed Enquiry** – Redirects to the complete/full enquiry form.
- This will clearly distinguish between a quick enquiry and a detailed enquiry.

10) Page Navigation – Scroll Position

- Currently, if the user scrolls down to a particular position on one page and then clicks another tab (such as **Services, About, Gallery, Contact, etc.**), the newly opened page retains the previous scroll position.
- This should be corrected.
- Whenever the user navigates to a **new page/tab**, it should automatically open from the **top of the page**.
- For example:
 - User scrolls halfway down the Home Page.
 - User clicks **Services**.
 - Services Page should open at the **top**, not at the same scroll position as the Home Page.
